Design Systems

# Bridging Design and Development

Swift Cairo, 28 Aug 2024

**What is a design system?**

**An ever-evolving set of standards that  
guides teams through creating digital products**

# Design System

Design tokens, documentation,  
core principles and best practices

## Components and Patterns

Reusable elements such as  
buttons, toggles, and more  
complex constructs

## Foundations

Includes color, typography,  
spacing, and brand  
guidelines

# What are design tokens?

**Design decisions that make up a  
design system's visual style**

# Design Tokens

Used for color, typography, spacing, animation, and more

## Reference

Directly tied to values

`klvr-ref-color-purple-500`  
`#5917c4`

## System

Design decisions based on product or system

`klvr-color-primary`  
`klvr-ref-color-purple-500`

## Component

References system tokens based on use

`button-primary-color-fill`  
`klvr-color-primary`

# Foundations

## Line Height

Here's a multiline paragraph  
to better illustrate line height

# Declaring Font Type

```
public func labelLarge(text: String, color: UIColor) -> NSAttributedString {
    switch Language.currentLanguage {
    case .english:
        switch UITraitCollection.current.userInterfaceStyle {
        case .dark:
            return createAttributedString(with: FontStyle(
                fontSize: 16.0,
                fontFamily: "Hauora",
                fontWeight: "SemiBold",
                lineHeight: 24.0,
                letterSpacing: 0.7,
                textCase: "ORIGINAL",
                textDecoration: "NONE"), text: text, color: color)
        case .light:
            return createAttributedString(with: FontStyle(
                fontSize: 16.0,
                fontFamily: "Hauora",
                fontWeight: "Bold",
                lineHeight: 24.0,
                letterSpacing: -0.5,
```

# Declaring Font Type

```
case .arabic:
    switch UITraitCollection.current.userInterfaceStyle {
    case .dark:
        return createAttributedString(with: FontStyle(
            fontSize: 17.0,
            fontFamily: "Vazirmatn",
            fontWeight: "Medium",
            lineHeight: 24.0,
            letterSpacing: 0.0,
            textCase: "ORIGINAL",
            textDecoration: "NONE"), text: text, color: color)
    case .light:
        return createAttributedString(with: FontStyle(
            fontSize: 17.0,
            fontFamily: "Vazirmatn",
            fontWeight: "SemiBold",
            lineHeight: 24.0,
            letterSpacing: 0.0,
            textCase: "ORIGINAL",
```

# Using Type Token

```
Text(labelLarge(text: "Welcome to Swift Cairo & Klivvr Meetup",  
                color: ColorTokens.onbackgroundvariant))
```

# Color

**light-primary-100**

#DECFFC

**light-primary-300**

#8C5BF1

**light-primary-600**

#4511AC

**dark-primary-100**

#B397ED

**dark-primary-300**

#9A71EF

**dark-primary-600**

#412A6F

# Declaring Color Tokens

```
public enum ColorTokens {  
    public static var primary: UIColor {  
        return color(dark: Dark.primary300, light: Light.primary400)  
    }  
    public static var background: UIColor {  
        return color(dark: Dark.neutral900, light: Light.neutral150)  
    }  
    // And more color tokens...  
}
```

# Using Color Tokens

```
// Setting a color using our dynamic color function  
view.backgroundColor = ColorTokens.surfacecontainer.color()
```

# Measurement

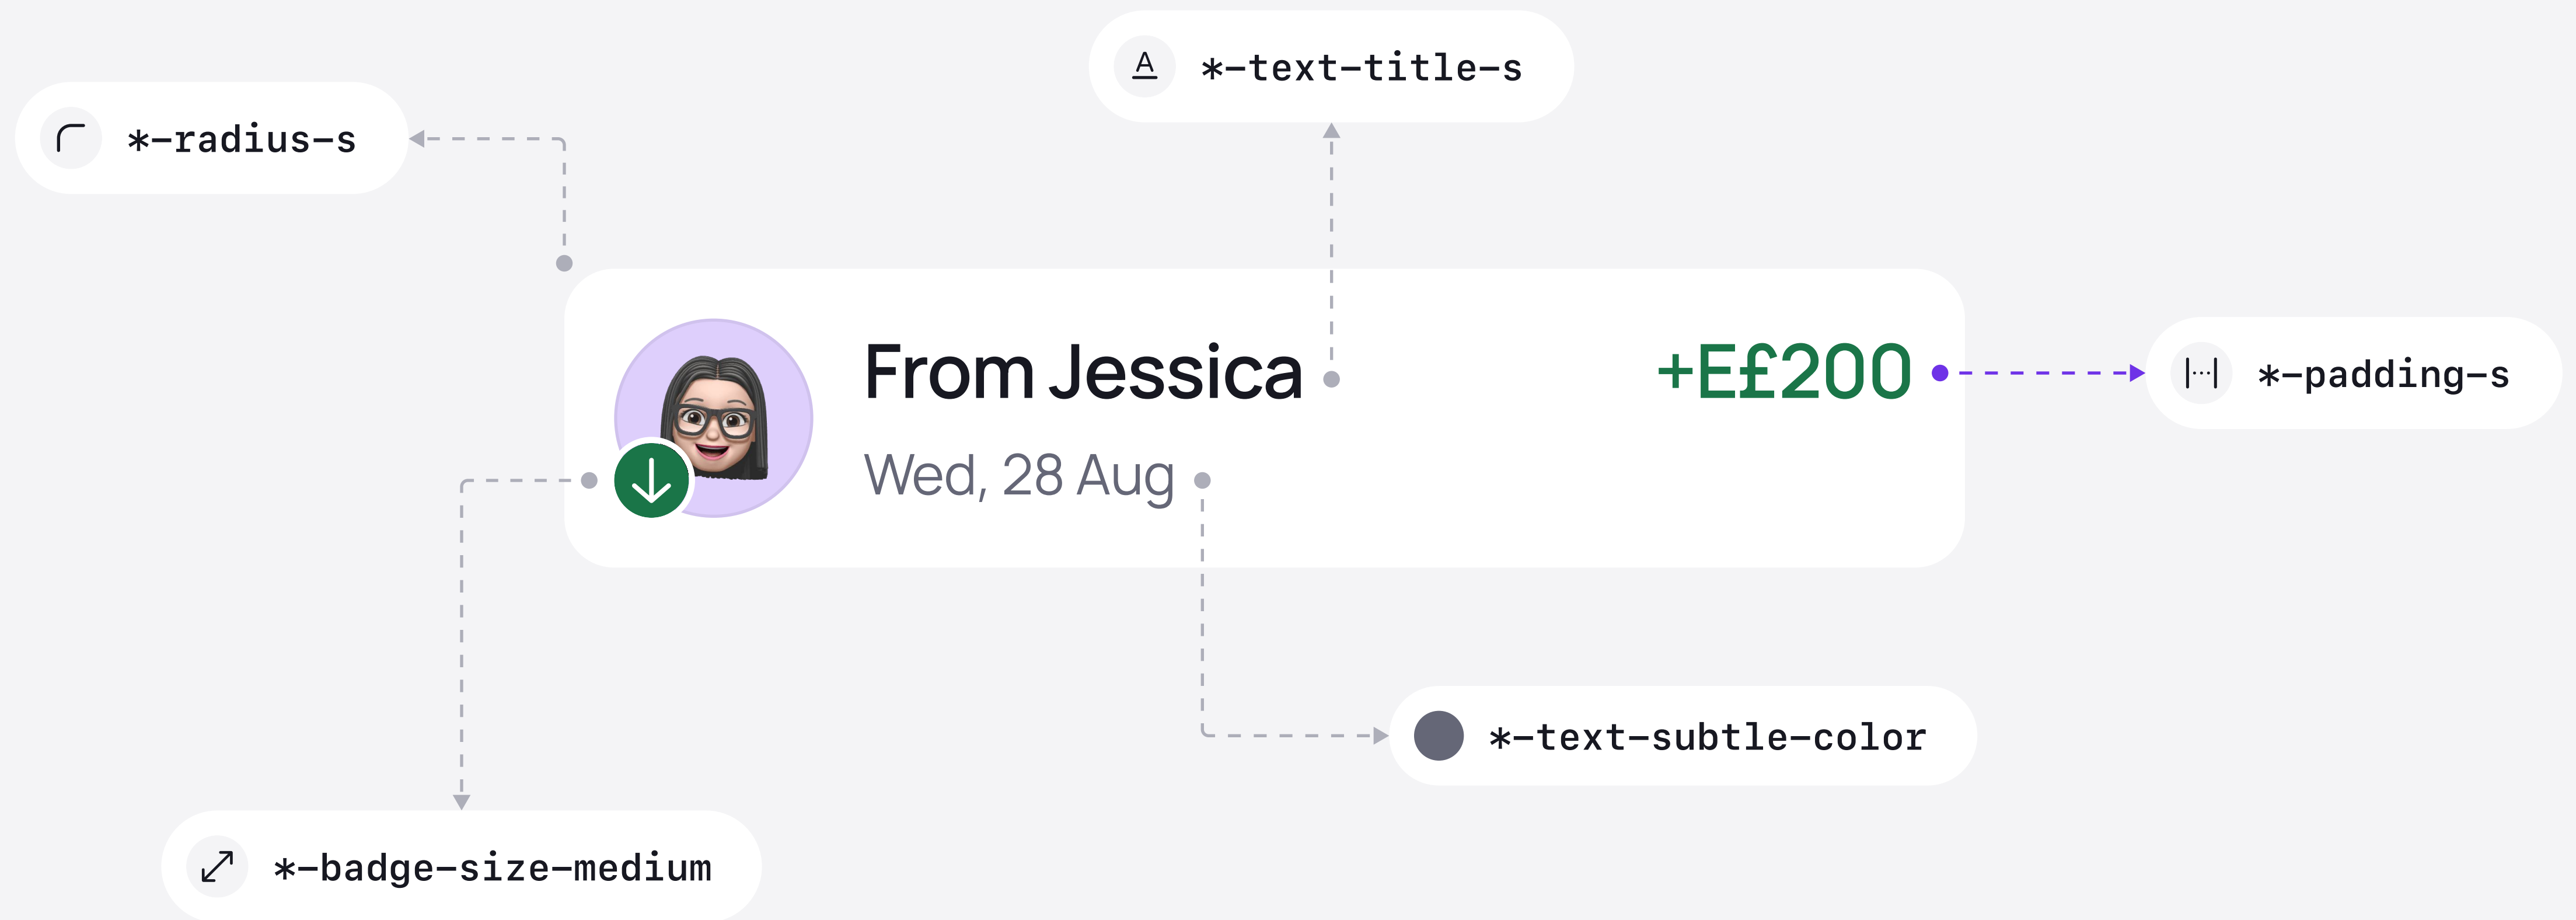

We use a **4px** grid system

Can vary based on project, but most flexible

Use **multiples** of your grid system for size and space

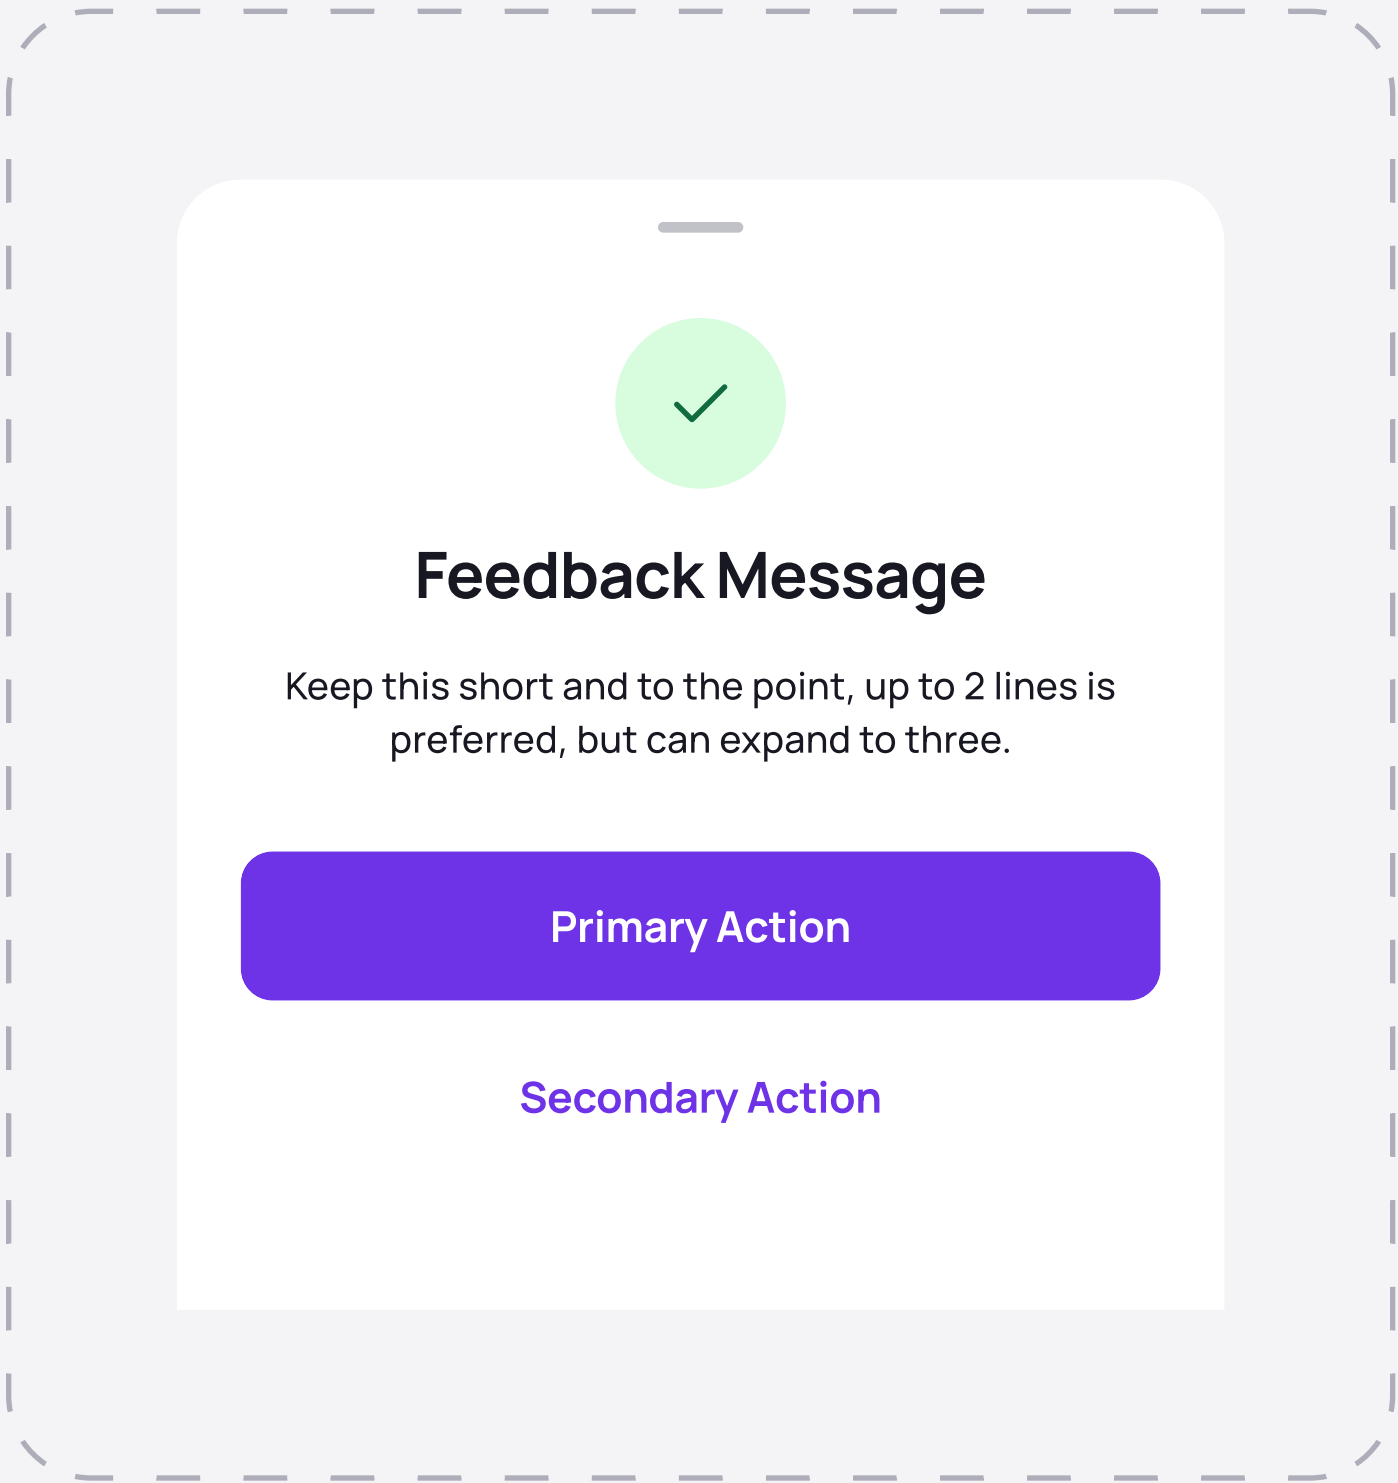

**Let's put this all together**

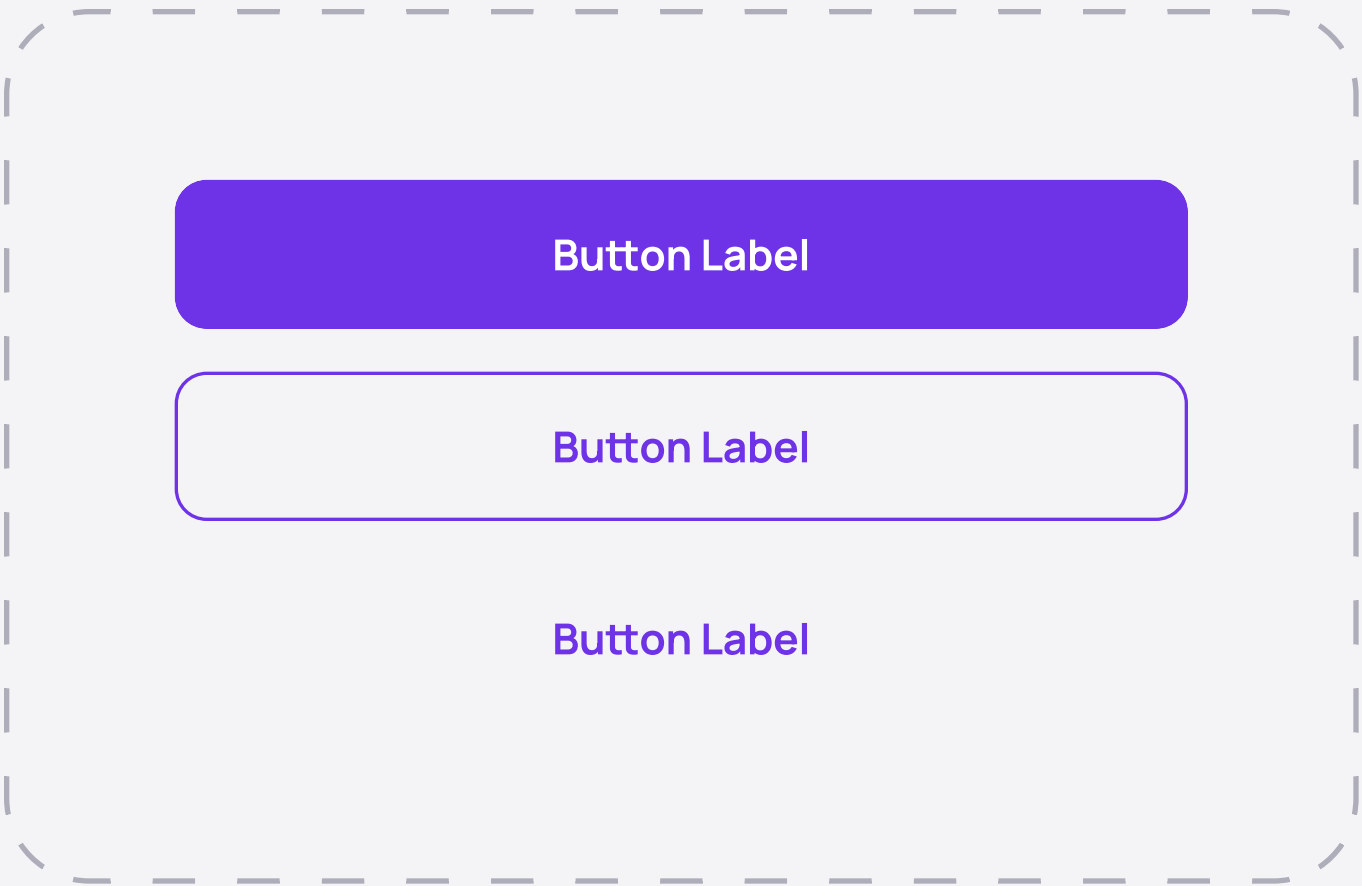

# Components

feedback-sheet

\_feedback-icons

**FEATURE DEMO**

# **Figma Code Connect**

**Install the Figma SDK and Figma CLI**

**Connect your component using its URL**

**Parse the generated variants to the component model**

**Publish and Voilà**

The ability to make quick, efficient updates using over-the-air (OTA) has transformed **Klivvr**'s approach to UX writing. Now, in-app content changes can be implemented instantly without the need for a full app update—a true game-changer for UX writers.

**Salma Sabry**, a UX Writer at Kilvvr, shares how this transformation in content management and error resolution ensures better user experiences. Discover more in her latest post: <https://lnkd.in/eqZpwEGQ>
